curl -X GET "http://192.168.0.2:9004/v1/options/system"
```

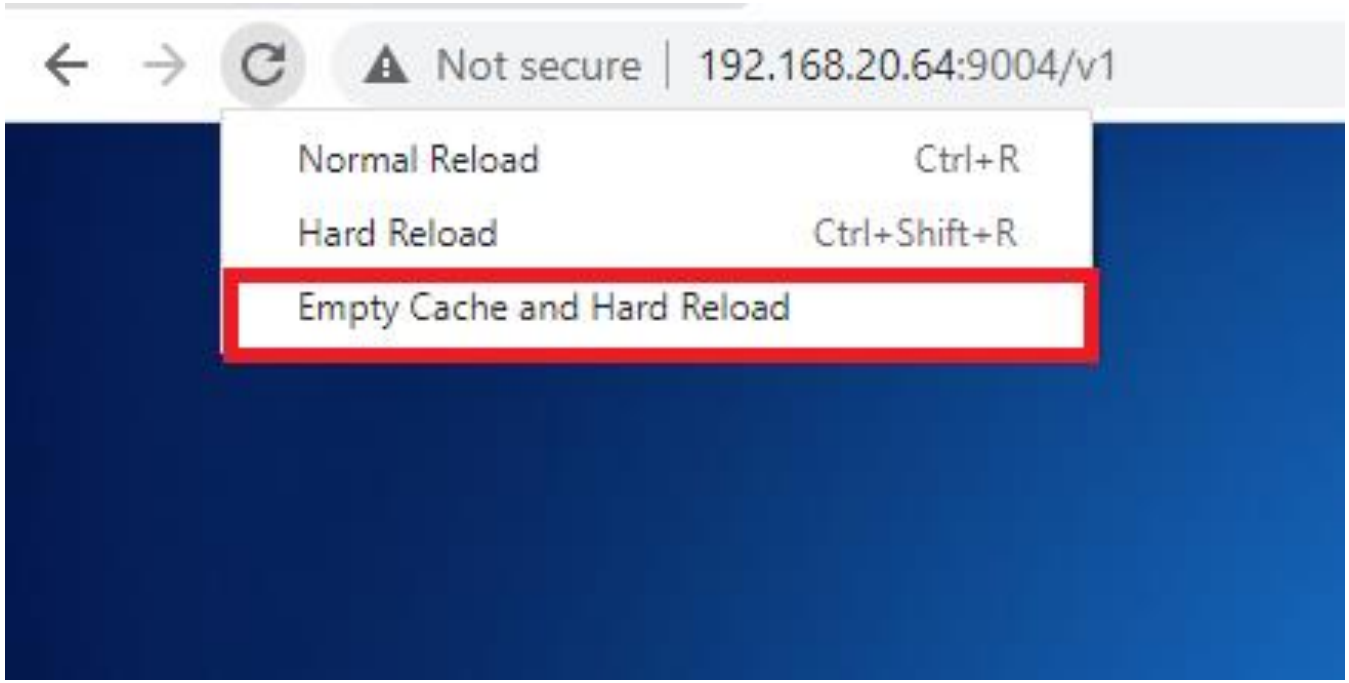
How to change IP in Alpeta API

2. Chane the ‘host’ IP of ‘swagger.json’, ‘swagger_kr.json’ in ‘C:□Program Files□UnionCommunity□UBio Alpeta□docs’ as below;

swagger_kr.json - Notepad

```
swagger: '2.0'
info:
  description: Server Web API document
  version: "1.0.0"
  title: Server Web API
  license:
    name: Apache 2.0
    url: 'http://www.apache.org/licenses/LICENSE-2.0.htm
host: '192.168.0.114:9004'
basePath: /v1
tags:
  - name: sessions
    description: 세션 관리
  - name: visitor
    description: 방문객
  - name: options
    description: 옵션 관리
  - name: users
    description: 사용자 관리
  - name: blacklists
```

swagger.json - Notepad

```
swagger: '2.0'
info:
  description: Server Web API document
  version: "1.0.0"
  title: Server Web API
  license:
    name: Apache 2.0
    url: 'http://www.apache.org/licenses/LICENSE-2.0.html'
host: '192.168.0.114:9004'
basePath: /v1
tags:
  - name: sessions
    description: Session manamement
    ###description: 세션 관리
  - name: visitor
    description: visitor
        ###description: 방문객
  - name: options
    description: Option management
    ###description: 옵션 관리
```


3. Run Alpeta and enter [**F12**] on the keyboard.
4. Right click button and select [**Empty Cache and Hard Reload**]
