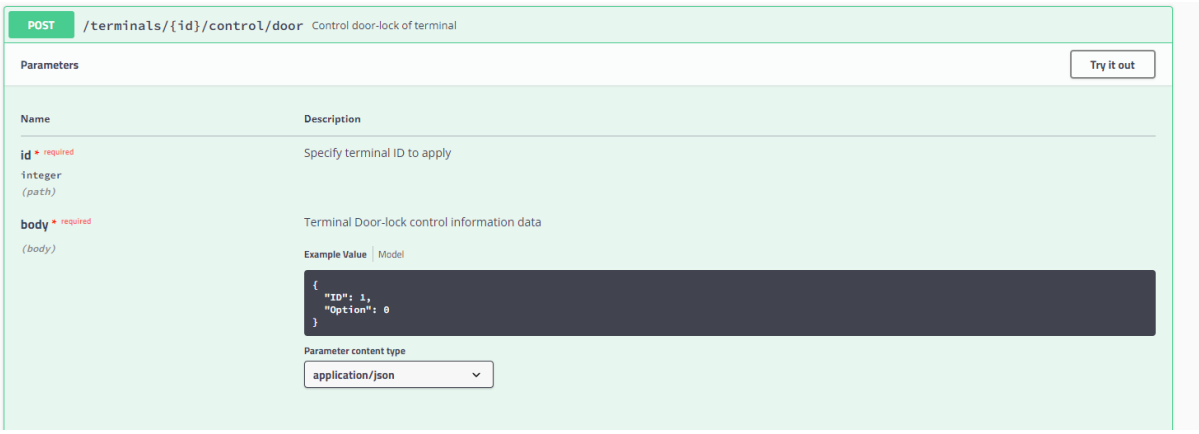
How to control the door-lock on the terminal with API

If you need the UBio Alpeta API, you can access the API from Alpeta

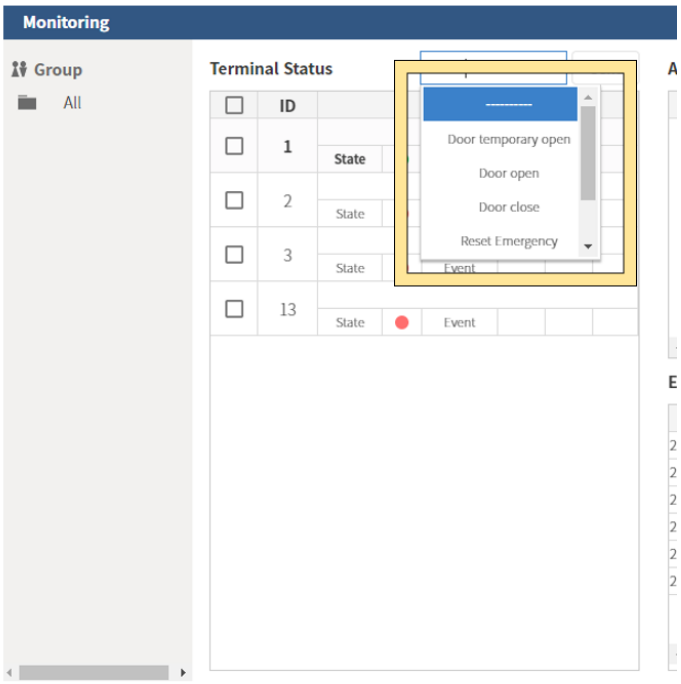
' **http://{IP address of your UBio Alpeta Server PC}:9004/v1/docs** '



/termials/{id}/control/door is a function that controls the lock of the device.

This is a function that can be checked in the Alpeta UI. (Yellow area of monitoring screen: see picture below)

I will share it with you after checking what functions are performed according to the value of the option.



Results based on the value of the option when using **/teminals/{id}/control/door**

option

0 = Door temporary open

1 = Door open

2 = Door close
