How to interpret the error code when using Alpeta API

Response body

```
{
  "Result": {
    "ResultCode": 0
  },
```

When you use the API, an error code may occur.
The error code is the number of result codes.
Interpret the error code to solve your error.

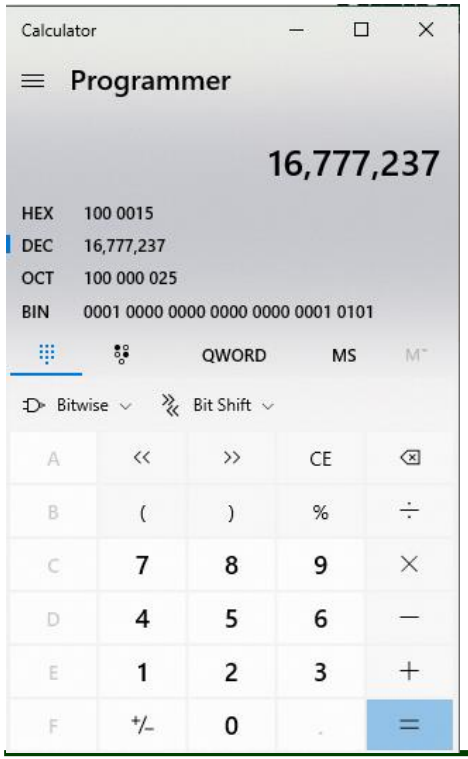
When the result code is 0, there is no error.

How to interpret the error code when using Alpeta API

Response body

```
{
  "Result": {
    "ResultCode": 16777237
  },
  "DuplicateInfo": {
    "DuplicateID": 4,
    "DuplicateUniqueID": "uniquecard",
    "DuplicateName": "Card"
  }
}
```

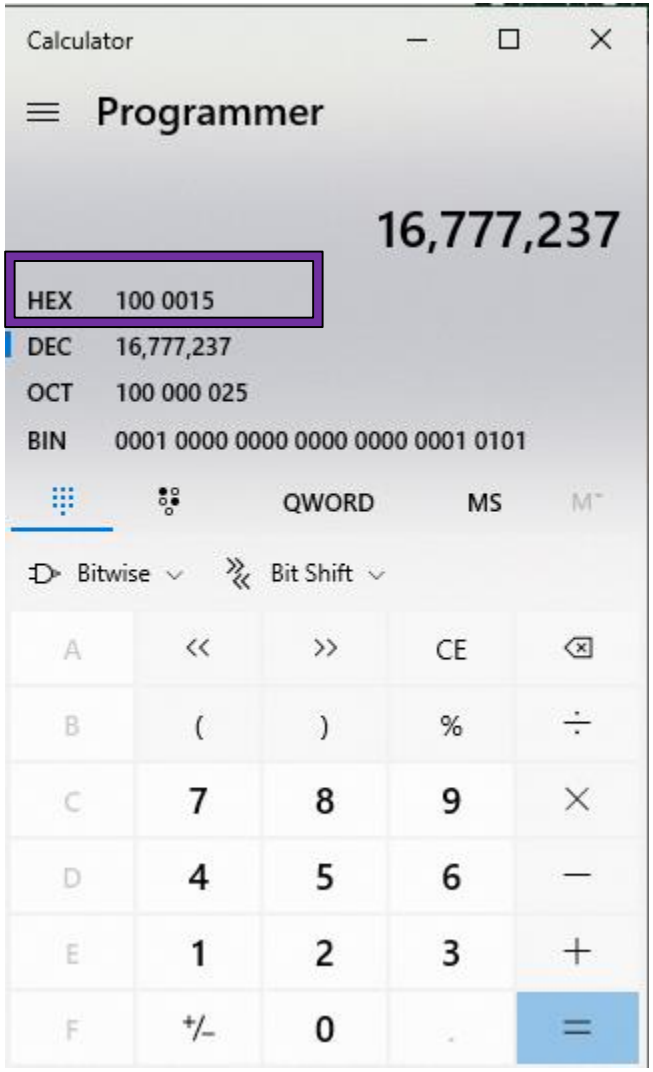
For example, an error of 16777237 occurred as above.



To check for errors, we need a calculator.
Please prepare a calculator in the programmer mode.

And enter the corresponding error code.
You must enter it in the Decimal value.

How to interpret the error code when using Alpeta API



Check the converted Hexa values through the calculator.

The value of the example is 100 0015.

After checking the first number, go to the error code description at the bottom of the doc page.

How to interpret the error code when using Alpeta API

```
ErrorCode01 ⌄ {
    ErrorUserDuplicateID                string
                                        example: 0x01000001
    ErrorUserNotExist                   string
                                        example: 0x01000002
    ErrorUserInvalidFPData              string
                                        example: 0x01000003
    ErrorUserAuthenticationFailed       string
                                        example: 0x01000004
    ErrorUserInvalidID                  string
                                        example: 0x01000005
    ErrorReDuplicateUniqueID            string
                                        example: 0x01000006
    ErrorReDuplicateNotUniqueID         string
                                        example: 0x01000007
    ErrorUserExist                      string
                                        example: 0x01000008
    ErrorUserNameInvalid                string
                                        example: 0x01000009
    ErrorUserAuthTypeInvalid            string
                                        example: 0x0100000A
    ErrorUserUniqueIDInvalid            string
                                        example: 0x0100000B
    ErrorUserPasswordInvalid            string
                                        example: 0x0100000C
    ErrorUserSimilarFingerprint         string
                                        example: 0x0100000D
    ErrorUserOldLoginPasswordDuplicate  string
                                        example: 0x0100000E
    ErrorUserLoginPasswordExpirationDate string
                                        example: 0x0100000F
    ErrorUserLoginFailCount             string
                                        example: 0x01000011
    ErrorUserLoginPasswordWrongInput    string
                                        example: 0x01000012
    ErrorUserRfCardDuplicate            string
                                        example: 0x01000013
    ErrorUserSimilarFace                string
                                        example: 0x01000014
    ErrorUserSimilarCard                string
                                        example: 0x01000015
    ErrorUserInvalidUserFod             string
                                        example: 0x01000016
    ErrorUserInvalidFAData              string
                                        example: 0x01000017
    ErrorUserInvalidLoginPwd            string
                                        example: 0x01000018
    ErrorUserInvalidLoginAllow          string
                                        example: 0x01000019
    ErrorUserLoginPasswordDuplicate     string
                                        example: 0x0100001A
    ErrorUserBlackListStatus            string
                                        example: 0x0100001B
    ErrorUserInvalidFaceWTData          string
                                        example: 0x0100001C
}
```

Click If you click the tab, you can check the description of the tab.

Find that the last digit of the converted hexa value matches the number in the example.

The code for the example was 100 0015, so we look for the last number of 15.

As a result, we can check that an error has appeared because the card value is duplicated.
